

From obs: "while I was skinning up to the rollover I popped off a wind slab approximately 50 X 50' with a 6" crown. The slab itself was only about 4" thick and only slid about 5" down the slope before stopping, and I was able to stop and then turn around and ski off of the slab without it moving any further. The 4" of dry slab was sitting on about 3" of sugary snow that was on a very firm icy bed surface." Photo: Anonymous

Advisory Region
Bridger Range
Longitude

-110.98W
